ABSTRACTED-PUB-NO: KR2002084972A

BASIC-ABSTRACT:

NOVELTY - A computer is provided to offer the beautiful appearance by preventing a door panel from inclining to one side.

DETAILED DESCRIPTION - A bezel(10) is placed on the front face of a main body casing and has at least one penetrating hole(13) on a panel. A door panel(30) is fixed to the front face of the bezel. A door opening/closing device(40) is slid to a closing position making the door panel partially cover the front face including the penetrating hole and an opening position making the penetrating hole open, and prevents the door panel from maintaining the eccentric inclination at the opening position. The door opening/closing device includes

a push button(40) for releasing the door panel from the bezel, a compressive spring(65) restoring the push button to an original position, a pair of linker(60) opening the door panel by linking with the push button, a tensile spring(67) restoring the linker to the original position, and a removal preventing part(70) preventing the push button and the linker from being removed from the bezel.
